PROSPERITY

The Prosperity variant is the named, discrete-win-condition version of Elizabeth Magie's Anti-Monopolist gameplay. It first appeared under this name in the 1932 Adgame Company edition ("Landlord's Game and Prosperity"), published under US Patent 1,509,312 — Magie's second patent. The related 1906 Single Tax rules describe the same underlying philosophy as a process without a named endpoint; Prosperity makes the win condition explicit: the game ends, and all players win collectively, when the poorest player has doubled their starting wealth.

The win condition fundamentally changes incentives. No player can win by bankrupting others — doing so ends the game as a collective loss. Richer players are motivated to assist poorer ones through loans or favourable arrangements, since the collective win is impossible while any player is bankrupt or below their starting wealth.

SETUP

As per the 1906 Commercial Edition.

RULES

As per the 1906 Commercial Edition, with the following change: the win condition is collective rather than individual. No player may be forced into bankruptcy during play. Players may freely assist each other with loans or other arrangements to prevent any player from going bankrupt.

WINNING

The game ends when the player with the least money has doubled their original starting stake. All players win collectively at that point.

Example: in a 3-player game with \$500 starting cash each, the game ends when the player currently holding the least money reaches \$1,000 — regardless of how much the other players hold.
